Quadrangles

**Family Note**

In this lesson, your child has been learning about different types of quadrangles, or polygons that have 4 sides. Quadrangles are also called *quadrilaterals*. In Problems 1 and 2 below, three shapes have a common attribute that the fourth shape does not have. In Problem 1, the square is different, because it is the only quadrangle with 4 square corners. In Problem 2, the rectangle is different, because it is the only quadrangle that doesn't have 4 equal sides.

Please return this Home Link to school tomorrow.

1. Look at the number of square corners. Which quadrangle is different from the other three?

square

rhombus

trapezoid

rhombus

2. Look at the lengths of the sides. Which quadrangle is different from the other three?

rhombus

rhombus

square

rectangle

Practice

3. $6 + 3 =$ _____

4. $5 + 9 =$ _____

5. $6 - 3 =$ _____

6. $8 - 5 =$ _____

7. $24 - 4 =$ _____

8. $56 - 50 =$ _____

9. $35 + 62 =$ _____

10. $25 + 66 =$ _____
